vISEC 2020

# Introduction

The **analysis of the dynamic of a population** has become a fundamental tool in ecology, conservation biology, and particularly in fisheries science to assess the status of exploited resources.

# Introduction

The *analysis of the dynamic of a population* has become a fundamental tool in ecology, conservation biology, and particularly in fisheries science to assess the status of exploited resources.

**Rfishpop** is an **R package** dealing with uncertainty for analyzing exploited populations.

# Introduction

The [analysis of the dynamic of a population](#) has become a fundamental tool in ecology, conservation biology, and particularly in fisheries science to assess the status of exploited resources.

[Rfishpop](#) is an **R package** dealing with uncertainty for analyzing exploited populations.

Rfishpop is [available on https://github.com/IMPRESSPROJECT/Rfishpop](https://github.com/IMPRESSPROJECT/Rfishpop). Furthermore, [tutorials](#) describing the use of our package are also available.

Welcome to the Rfishpop wiki!

In this wiki you can find several tutorials to start the use of our package Rfishpop.

[First tutorial \(also in the repository "Tutorials Rfishpop" with html results\)](#)[Second tutorial](#)[Third tutorial](#)

# Generic age-structured operating model (OM)

The package includes tools to simulate the **real dynamics of a fishery system using a generic age-structured operating model (OM)**.

Population.Modeling {Rfishpop}

R Documentation

## Modeling an Exploited Population (Structured by Age)

### Description

Provides a flexible and generic operating model (OM) which simulates the real dynamics of the fishery system. The OM is formed by biological, fishery and control components. The stock is described as age structured population along the time.

### Usage

```
Population.Modeling(ctrPop, ctrBio, ctrFish, SR)
```

OM includes a **biological system** with recruitment, growth, maturity and mortality and a **fishery system** where fishing intensity and selection are modeled.

This system allows to implement structural **uncertainty** having different options for each process and natural stochasticity playing with variability in these processes.

## Maximum Sustainable Yield (MSY) reference points

The package also contains a set of methods to estimate **Maximum Sustainable Yield (MSY) reference points**. These allow to identify management targets in terms of fishing intensity, population status and yield.

```
RF(Pop.Mod, 3,3,Method="mean",par=NULL,FM_type="F_msy",iters=1:2)
```

```

```

# Statistical methods to simulate sampling error

The package also contains [statistical methods to simulate sampling error](#), which is another source of uncertainty in fishery management, providing different data types which can suit different assessment methods, from simple data-limited methods to more complex age or length-structured methods.

## Population dynamic tools in support of fisheries management

### Documentation for package 'Rfishpop' version 0.1.0

# Assessment models

The data obtaining from the sample functions are passed to the [assessment model](#).

Our package does not implement any assessment models, the idea is to [use available implementations of the assessment models](#).

The package contains [specific functions](#) to change the format of the data into the [required format of the assessment model function](#). Now, the package contains such function for the [data-poor method](#), [LBI](#) and [LB-SPR](#). The list of functions will be expanded when exploring the application of other assessment models to the data reported by our package.

**Data.to.LB.SPR(Pop.Mod,...)**

**Data.to.LBI(Pop.Mod,...)**

# Implementation of the HCR

**Projecting our Exploited Population:** This function allows us to extend our simulated Population through the years on based of the desired captures for such years or on based of the desired effort for such years.

## Projecting our Exploited Population

### Description

This function allows us to extend our simulated Population through the years on based of the desired captures for such years (`strategy="catch"`) or on based of the desired effort  $f$  (component of fishing mortality  $F = f * SEL$ ) for such years (`strategy="effort"`).

### Usage

```
Population.Modeling.Projections(  
  Pop.Mod,  
  new.years,  
  my.catch,  
  tol,  
  limit.f,  
  strategy,  
  my.effort  
)
```

Concluding, the described functions of **Rfishpop** package allow to verify the performance of management strategies or procedures in different settings generated from the OM.

Concluding, the described functions of **Rfishpop** package allow to verify the performance of **management strategies or procedures in different settings generated from the OM.**

Thanks for your attention!
